ACEA Oil Sequences 2023

Service fill oils for gasoline engines, light-duty diesel engines, engines with aftertreatment devices and heavy-duty diesel engines

Formulating tomorrow together

This publication has been derived from the official ACEA Oil Sequences documents, the latest versions of which can be found at: www.acea.auto

The accuracy of this publication is the responsibility of Infineum, the aforementioned original documents on www.acea.auto remains the sole point of reference and will be updated in case of any changes to the ACEA Oil Sequences.

The latest sequences have been designed to address engine developments that are being driven by both regulatory and performance needs, complemented by necessary test maintenance requirements.

Light Duty Engine Oil Sequence Updates

The ACEA A/B high SAPS category and the ACEA C lower SAPS categories have been updated with:

- New C7 category introduced
- OM646LA wear test re-introduced for legacy categories

Heavy Duty Engine Oil Sequence Updates

The ACEA E high and lower SAPS category have been updated as follows:

The ACEA E6 and E9 categories have been removed and are now replaced by the ACEA E8 and E11 categories, respectively, both of which now include the Caterpillar Oil Aeration Test (ASTM D8047) and the Volvo T-13 oxidation engine test (ASTM D8048).

Furthermore, the OM501LA piston cleanliness test (CEC L-101-09) has now been replaced by the OM471 test (CEC L-118-21) in ACEA E4 and E8, by the Cat 1N test (ASTM D6750) in ACEA E7, and by the Cat C13 test (ASTM D7549) in ACEA E11.

Finally the reporting of the chlorine content (ASTM D6443) is now mandatory in all heavy-duty engine oil categories.

Conditions for use of performance claims against the ACEA Oil Sequences

ACEA requires that any claims for oil performance to meet these Oil Sequences must be based on credible data and controlled tests in accredited test laboratories.

ACEA requires that engine performance testing used to support a claim of compliance with these ACEA Oil Sequences should be generated according to the European Engine Lubricants Quality Management System, EELQMS (available at www.eelqms.eu), but ACEA reserves the right to define alternatives in exceptional cases.

EELQMS addresses product development testing and product performance documentation, and involves the registration of all candidate and reference oil testing and defines the compliance process. Compliance with the ATIEL Code of Practice. which forms part of the EELQMS, is mandatory for any claim to meet the requirements of this issue of the ACEA Sequences. Therefore, ACEA requires that claims against the ACEA Oil Sequences can only be made by oil companies or oil distributors who have signed the EELQMS oil marketers' Letter of Conformance (for details: www.atiel.eu).

The ACEA Oil Sequences are subject to continuous development. Replacement tests and other changes required by the European vehicle manufacturers are integrated and new issues are published on a regular basis. As new editions are published older editions have to be withdrawn. Validities of new and old editions are overlapping for limited periods of time as shown in the following table and the accompanying text below. When a new ACEA Oil Sequence is introduced, oils with claims against the previous can be marketed only for another two years.

Sequence issue	First allowable use	Mandatory for new claims	Oils with this claim may be marketed until
	ACEA H	eavy-Duty engine oil sequences	
2016	1 December 2016	1 December 2017	1 May 2024
2022	1 May 2022	1 May 2023	
	ACEA L	ight-Duty engine oil sequences	
2016	1 December 2016	1 December 2017	1 May 2023
2021	1 May 2021	1 May 2022	1 August 2025
2023	12 September 2023	12 September 2024	

First allowable use means that claims cannot be made against the specification before the date indicated.

Mandatory for new claims means that from this date onward all claims for new oil formulations must be made according to the latest ACEA Oil Sequence Issue. Up to that date new claims can also be made according to the previous ACEA Oil Sequence Issue. After the date indicated no new claims to the previous ACEA sequence can be made. Then all oil formulations must be developed according to the latest ACEA release.

Oils with this claim may be marketed until means that no further marketing of oils with claims to this issue is allowed after the date indicated. The marketer of any oil claiming ACEA performance requirements is responsible for all aspects of product liability.

In the tables in the next pages, where limits are shown relative to a reference oil, then these must be compared to the last valid Reference Result on that test stand prior to the candidate and using the same hardware. Further details are in the ATIEL Code of Practice.

ACEA 2023 European oil sequence for service-fill oils for gasoline and light-duty diesel engines

Sep 2023 Rev.0

This sequence defines the minimum quality level of a product for self-certification to EELQMS and for presentation to ACEA members. Individual member companies may indicate performance parameters other than those covered by the tests shown or morestringent limits.

*/**: Footnotes referring to the following requirements in the A-/B- and C-classes:

No 2.1, 2.6, 2.7, 2.8 ** Parameter is not an official CEC Parameter

No 2.6

No 2.7

The CEC L-111-16 (EPG) lifetime is limited. If the test becomes unavailable during the lifetime of these ACEA Oil Sequences, ACEA intends to introduce a successor test on PSA hardware at a similar severity level. No 2.1

Alternatively, Sequence VG (ASTM D6593) results meeting ACEA 2016 requirements can be used in place of Sequence VH for all categories. The Sequence VG limits for ACEA 2016 are: Average engine sludge, merits: ≥7.8; No 2.2 Average moker cover sludge, merits: \geq 8.0; Average engine varnish, merits: \geq 8.9; Average piston skirt varnish, merits: \geq 7.5; Hot-stuck compression rings: None; Oil screen dogging, % area: \leq 20.

No 2.3 Alternatively, Sequence IVA (ASTM D6891) data can be used for A3/B4, A5/B5, C2, C3, C4 and C5 categories at the following limit: Cam wear average: max 90 microns.

Alternatively to the CEC L-107-19, results of the Daimler M271 sludge test as described by Daimler AG can be used for A3/B4, A5/B5 and C2, C3, C4, C5. For this test, reference oil changed from RL140 to RL261. Results relative to RL140 or RL261 can be used to demonstrate ACEA performance. The applicable limit with RL261 is \geq RL261 + 1σ . The applicable limit with RL140 is \geq RL140 + 4σ . Test results obtained by the Daimler M271 test No 2.4 procedure will be accepted only under the condition that they come from test rigs being referenced and quality controlled by Daimler AG.

The CEC L-106-16 (DVGC) lifetime is limited. If the test becomes unavailable during the lifetime of these ACEA Oil Sequences, ACEA intends to introduce a successor test on PSA hardware at a similar severity level.

CEC L-99-08 (Diesel Engine wear) is reintroduced in the 2023 sequence for following oil categories: A3/B4, A5/B5, C2, C3, C4 and C5. By reintroduction of this test in 2023 all claims according to ACEA-23 of the before mentioned ACEA categories have to run the test.

No 2.8 Alternatively, CEC L-78-99 (TDI2) results can be used as specified in the table below

CEC L-78-99 limits applicable for		A3/B4	A5/B5, A7/B7	C2	C3, C4, C5, C6, C7

*/**: Footnotes referring to the following requirements:

Unless otherwise stated, for ASTM engine tests in these ACEA HD Sequences, data meeting the requirements of API CK-4 are acceptable, including Multiple Test Evaluation Procedures (MTEP).

No 2.2 ASTM D5967 (Mack T-8E): Data meeting the requirements of API CH-4 are acceptable, including Multiple Test Evaluation Procedures (MTEP). Mack T-11 results obtained as part of an API Cl-4, Cl-4 plus, Cl-4, CK-4 or FA-4 approval program, can be used in place of Mack T-8E.

No 2.31 CEC L-118-21 (OM471): Alternatively, CEC L-101-09 (OM501LA) data meeting the requirements of ACEA E4-16 can be used to support an ACEA E4 claim.

No 2.32 ASTM D6750 (CAT 1N): Alternatively, CEC L 101-09 (OM501LA) data meeting the requirements of ACEA E7-16 can be used to support an ACEA E7 daim. Alternatively, CEC L 118 21 (OM471) data meeting the requirements of ACEA E4 22 / E8 22 can be also be used to support an ACEA E7 22 claim

ASTM D7549 (CAT C13): Alternatively, CEC L-101-09 (OM501LA) data meeting the requirements of ACEA E9-16 can be used to support an ACEA E11 claim. Alternatively, CEC L 118 21 (OM471) data meeting the requirements of ACEA E4 22 / E8 22 can be also be used to support an ACEA E11 22 claim.

No 2.4 ASTM D7468 (Cummins ISM): For ACEA E7, data meeting the requirements of API CI-4 are acceptable, including Multiple Test Evaluation Procedures (MTEP).

For ACEA E11, merit number shall be calculated according to the CK-4 specification. No 2.5 ASTM D7422 (Mack T-12):

For ACEA E7 only:

Data meeting the requirements of API CI-4 are acceptable, including Multiple Test Evaluation Procedures (MTEP). Merit number shall be calculated according to the API CI-4 specification.

 ${\sf Mack T-\!10} \ {\sf results} \ {\sf obtained} \ {\sf as} \ {\sf part} \ {\sf of} \ {\sf an} \ {\sf API CI-\!4} \ {\sf or} \ {\sf CI-\!4} \ {\sf plus} \ {\sf approval} \ {\sf program, can} \ {\sf be} \ {\sf used} \ {\sf in} \ {\sf place} \ {\sf of} \ {\sf Mack T-\!12}.$

Mack T-12 Cylinder Liner Wear and Top Ring Weight Loss results obtained as part of an API CK-4 or FA-4 approval program, which includes a passing Volvo T-13 at the API CK-4 or API FA-4 level, may be used to satisfy the requirements of the Mack T-12 in the ACEA Oil Sequences.

No. 2.6 ** Not CEC approved parameters.

Certification and registration

Claims against the ACEA Oil Sequences can be made on a self-certification basis. For any claim being made, ACEA recommends that oil suppliers register their products with the ACEA registration system on the ACEA website after their launch into the market. Registration does not replace the required EELQMS oil marketers' letter of conformance registration in SAIL (Services to Associations and Industry in the Lubricants sector) www.sail-europe.eu/.

All information needed for registering in ACEA's registration system is available on ACEA's website - https://app.acea.be/EOR. After the form is completed, it will be saved on the ACEA server. If claims are no longer

needed, oil companies are asked to delete their registration. If registered claims continue to be used after three years, reregistration is recommended.

Where claims are made that oil performance meets the requirements of the ACEA Oil Sequences (e.g. product literature, packaging, labels) they must specify the ACEA Class and Category (see Nomenclature & ACEA Process for definitions).

Each set of ACEA Oil Sequences is designated for consumer use by a two-part code comprising a letter to define the class (eg C), and a number to define the category (eg C2).

In addition, for industry use, each sequence has a two-digit number to identify the year of implementation of that severity level (eg A3/B4-21).

Classes may be added in future if, for example, natural gas engines, H2 combustion engines or engines which operate with alternative fuels (e-fuels), prove to require oil characteristics which cannot readily be incorporated into existing classes.

The category indicates oils for different purposes or applications within that general class, related to some aspect or aspects of the performance level of the oil. Typical applications for each category are described in the light-duty and heavy-duty sequence documents for guidance only. Specific applications of each category are the responsibility of the individual motor manufacturer for their own vehicles and engines. Oils within a category may also meet the requirements of another category, but some engines may only be suited to oils of one category within a class.

The year numbers for each ACEA Oil Sequences document are intended only for industry use and indicate the year of implementation of that severity level for the particular category. A new year number will indicate, for example, that a new test, parameter or limit has been incorporated in the category to meet new

/ upgraded performance requirements whilst remaining compatible with existing applications. An update must always satisfy the applications of the previous issue. If this is not the case, then a new category is required.

An administrative issue number is added for industry use where it is necessary to update the technical requirements of a sequence without the intention to increase severity (eg when a CEC test engine is updated to the latest version whilst maintaining equivalent severity, or where a severity shift in the test requires modification of the specified limits).

Consumer language

A/B: Gasoline and diesel engine oils - 'High SAPS'

- A3/B4 Stable, stay-in-grade engine oil intended for use in passenger car and light-duty gasoline & diesel engines and/or for extended oil drain intervals where specified by the engine manufacturer.
- A5/B5 Stable, stay-in-grade engine oil intended for use at extended oil drain intervals in passenger car and light-duty gasoline & DI diesel engines designed for low viscosity engine oils with HTHS viscosity of 2.9 to 3.5 mPas. These engine oils are unsuitable for use in certain engines consult vehicle-OEM's owner's manual/handbook in case of doubt.
- A7/B7 Stable, stay-in-grade engine oil intended for use at extended oil drain intervals in passenger car and light-duty gasoline & DI diesel engines designed for low viscosity engine oils with HTHS viscosity of 2.9 to
 - 3.5 mPa s. Relative to A5/B5 these engine oils provide also low speed pre-ignition- and wear protection for turbocharged gasoline DI engines as well as turbocharger compressor deposit (TCCD) protection for modern DI diesel engines. These engine oils are unsuitable for use in certain engines consult vehicle-OEM's owner's manual/handbook in case of doubt
- C: Catalyst and GPF/DPF compatible engine oils for gasoline and diesel engines – 'Low SAPS'

Note: These oils will increase the DPF/GPF and TWC

life and maintain the vehicle's fuel economy.

Warning: Some of these categories may be unsuitable for

use in certain engine types – consult the manufacturer's owner manual/handbook in case

of doubt.

C2 Stable, stay-in-grade engine oil with mid-SAPS Level, for aftertreatment system compatibility. Intended for use at extended oil drain intervals in passenger car and light-duty gasoline & DI diesel engines designed for low viscosity engine oils with a minimum HTHS Viscosity of 2.9 mPas.

- C3 Stable, stay-in-grade engine oil with mid-SAPS Level, for aftertreatment system compatibility. Intended for use at extended oil drain intervals in passenger car and light-duty gasoline & DI diesel engines designed for engine oils with HTHS viscosity of minimum 3.5 mPas
- C4 Stable, stay-in-grade engine oil with low-SAPS Level, for aftertreatment system compatibility. Intended for use at extended oil drain intervals in passenger car and light-duty gasoline & DI diesel engines designed for engine oils with HTHS viscosity of minimum 3.5 mPa s.
- C5 Stable, stay-in-grade engine oil for improved fuel economy, with mid-SAPS Level, for aftertreatment system compatibility. Intended for use at extended oil drain intervals in passenger car and lightduty gasoline & DI diesel engines designed and OEM-approved for engine oils with HTHS viscosity of minimum 2.6 mPas.
- C6 Stable, stay-in-grade engine oil for improved fuel economy, with mid-SAPS Level, for aftertreatment system compatibility. Intended for use at extended oil drain intervals in passenger car and light-duty gasoline & DI diesel engines designed and OEM-approved for engine oils with HTHS viscosity of minimum 2.6 mPas. Relative to C5 these engine oils provide also low speed pre-ignition- and wear protection for turbocharged gasoline DI engines as well as turbocharger compressor deposit (TCCD) protection for modern DI diesel engines.
- C7 Stable, stay-in-grade engine oil for improved fuel economy, with mid-SAPS Level, for affertreatment system compatibility. Intended for use at extended oil drain intervals in passenger car and lightduty gasoline & DI diesel engines designed and OEM-approved for engine oils with HTHS viscosity of minimum 2.3 mPas. C7 is based on C6 performance levels, with the exception of enhanced fuel economy.

SAPS: Sulphated Ash, Phosphorus, Sulphur HTHS: High Temperature High Shear Viscosity

DI: Direct Injection DPF: Diesel Particle Filter GPF: Gasoline Particle Filter TWC: Three-Way Catalyst

E: Heavy Duty Diesel engine oils

OEM manual is mandatory, the below table gives an overview For oil drain interval information please refer to the OEM manual

Engine Oil	Euro VI	Euro I, II,	EGR engine	Exhaust	Fuel co	mpatibility	
Sequence	Stage IIIb, IV, V	III, IV, V Stage I, II, IIIa	compatibility	treatment (DPF, SCR & Catalyst)			How to read the table
E4	X	ļ		X	√	į.	
E7	X	!	√	X	√	!	√ recommended
E8	√	✓	√	✓	İ	✓	for some applications
E11	√	✓	√	✓	İ	✓	X not recommended

^{* &}gt;50 ppm Sulphur

^{**} Recommendations may differ between engine manufacturers, especially with >87 biodiesel blends; please consult driver manuals and/or dealers if in doubt.
